COOKIES AND SESSION (UNIT-4)

PREPARED BY- N. K. SHUKLA(LECT., COMPUTER DEPARTMENT, AVPTI)

Client Side vs. Server Side

When a client (your computer) makes a request for a web page that information is processed by the web server. If the request is a server side script (e.g. Perl or PHP) before the information is returned to the client the script is executed on the server and the results of the script is returned to the client.

Once the client receives the returned information from the server if it contains a client side script (e.g. JavaScript) your computer browser executes that script before displaying the web page.

Local Computer

Internet

Web server

page in html

Cookies

- **Definition:** “ Cookies are text files stored on the client computer and they are kept to track user. ”

1. User or web browser request a webpage

2. Web server requests the web browser to create cookie *pageview* 1

3. Web browser stores cookie *pageview* 1

4. User requests the same website later

5. Web server reads the *pageview* cookie and increases its value by 1

Cookies

There are three steps involved in identifying returning users –

- ▶ Server script sends a set of cookies to the browser. For example name, age, or identification number etc.
- ▶ Browser stores this information on local machine for future use.
- ▶ When next time browser sends any request to web server then it sends those cookies information to the server and server uses that information to identify the user.

Creating Cookie

- ▶ PHP provided `setcookie()` function to set a cookie. This function requires upto six arguments and should be called before `<html>` tag. For each cookie this function has to be called separately.
- ▶ Syntax:

`setcookie(name, value, expire, path, domain, security);`

Here is the detail of all the arguments –

- ▶ **Name** – This sets the name of the cookie and is stored in an environment variable called `HTTP_COOKIE_VARS`. This variable is used while accessing cookies.
- ▶ **Value** – This sets the value of the named variable and is the content that you actually want to store.

Cookies

- ▶ **Expiry** – This specifies a future time in seconds since 00:00:00 GMT on 1st Jan 1970. After this time cookie will become inaccessible. If this parameter is not set then cookie will automatically expire when the Web Browser is closed.
- ▶ **Path** – This specifies the directories for which the cookie is valid. A single forward slash character permits the cookie to be valid for all directories.
- ▶ **Domain** – This can be used to specify the domain name in very large domains and must contain at least two periods to be valid. All cookies are only valid for the host and domain which created them.
- ▶ **Security** – This can be set to 1 to specify that the cookie should only be sent by secure transmission using HTTPS otherwise set to 0 which means cookie can be sent by regular HTTP.

Creating or setting Cookie

Retrieving or accessing Cookies

- ▶ PHP provides many ways to access cookies. Simplest way is to use either `$_COOKIE` or `$HTTP_COOKIE_VARS` variables.
- ▶ `$_COOKIE` used to access or retrieve value of cookie variable which is set by `setcookie()` function.
- ▶ `$_COOKIE(var_name);`

- ▶ We then retrieve the value of the cookie "user" (using the global variable `$_COOKIE`). We also use the `isset()` function to find out if the cookie is set:
- ▶ For Eg.

```
If (isset($_COOKIE($UserId))  
{  
}
```

EXAMPLE: Get user's name and age and store it in cookie and display on another page.

#Creating Cookie...

```
<?php
    setcookie("name", "John Watkin", time()+3600);
    setcookie("age", "36", time()+3600,);
?>
<html>

    <head>
        <title>Setting Cookies with PHP</title>
    </head>

    <body>
        <?php echo "Set Cookies"?>

    </body>

</html>
```

#Retrieving Cookie...

```
<html>
    <head>
        <title>Accessing Cookies with PHP</title>
    </head>
    <body>
        <?php
            if(isset($_COOKIE["name"]))
            {
                echo $_COOKIE["name"]. "<br />";
                /* is equivalent to */
                echo $HTTP_COOKIE_VARS["name"]. "<br />";
            }
            if(isset($_COOKIE["age"]))
            {
                echo $_COOKIE["age"] . "<br />";
            }
        ?>
    </body>
</html>
```

Modifying and Deleting Cookie:

- ▶ To **modify** a cookie, just set (again) the cookie using the **setcookie()** function:

```
setcookie("name", "Ajay", time()+3600);
```

- ▶ To **delete** a cookie, use the **setcookie()** function with an expiration date in the past:

```
setcookie("user", "", time() - 3600);
```

- ▶ `//Set expiration date of cookie 1 hour ago.`

Deleting Cookie...

```
▶ <?php
    setcookie( "name", "", time()- 60, "/", "", 0);
    setcookie( "age", "", time()- 60, "/", "", 0);
    ?>

<html>
    <head>
        <title>Deleting Cookies with PHP</title>
    </head>
    <body>
        <?php echo "Deleted Cookies" ?>
    </body>

</html>
```

Manage Cookie using browser

❖ Chrome

- ▶ From the Chrome menu in the top right corner of the browser, select Settings.
- ▶ At the bottom of the page, click Show advanced settings....
- ▶ Under Privacy, select Content settings....
 - ▶ To manage cookie settings, check or uncheck the options under "Cookies".
 - ▶ To view or remove individual cookies, click All cookies and site data... and hover the mouse over the entry. Select the X that appears next to the cookie to remove it.
 - ▶ To delete all cookies, click All cookies and site data... and select Remove all.

Firefox:

1. From the Tools menu, select Options.
 - ▶ If the menu bar is hidden, press Alt to make it visible.
2. At the top of the window that appears, click Privacy.
 - ▶ To manage cookie settings, from the drop-down menu under "History", select Use custom settings for history. Enable or disable the settings by checking or unchecking the boxes next to each setting:
 - ▶ To allow sites to set cookies on your computer, select Accept cookies from sites. To specify which sites are always or never allowed to use cookies, click Exceptions.
 - ▶ To accept third-party cookies, check Accept third-party cookies. In the "Keep until:" drop-down menu, select the time period you wish to keep cookies on your computer.
 - ▶ To specify how the browser should clear the private data it stores, check Clear history when Firefox closes. Click Settings.... Check the items to be cleared when you close Firefox.
 - ▶ To view or remove individual cookies, click remove individual cookies.
 - ▶ To remove all cookies, from the History menu, select clear your recent history. Click the arrow next to "Details" to expand the menu, check the items you want to clear, and then click Clear Now.

The background features abstract, overlapping geometric shapes in various shades of blue, ranging from light sky blue to deep navy blue. These shapes are primarily located on the right side of the image, creating a modern, layered effect. The rest of the background is a solid, very light blue.

Thank You
